

PremierChoice Group

A SECURE AND ENCRYPTED SOLUTION

PRIVATE WIDE AREA NETWORK (PWAN)

CHALLENGES

- Businesses need an encrypted network to ensure secure handling of sensitive customer data.
- Organisations with multiple sites are at the mercy of multiple providers and their unprotected networks which run through the public internet.

SOLUTION

- All businesses using IP technology will automatically be placed onto Premier Choice Group's Private Wide Area Network (PWAN).
- Our secure access ensures your customer data remains safe behind our PWAN firewall.
- Site-to-site connection capability brings multiple sites together as one.
- Remote access connection supports remote workers.
- The network can be accessed anywhere from your business or on the move.
- Sites with PWAN cannot make anonymous online connections; PWAN only allows authorised remote access and makes use of high encryption techniques.
- All of this means companies with PWAN can be assured that they are not exposed to any risks of transmitting data over the public internet.
- The PWAN has built-in continuity which ensures practices can meet IT Governance standards.

BENEFITS

INCREASED SECURITY

- Our PWAN ensures that businesses experience a more reliable service than our competitors are able to offer.
- Dedicated data lines permit secure data transmission at a fixed cost.

MULTI-SITE CONNECTIVITY

- Sites can be linked and configured to communicate privately, and can then be centrally managed; one point of contact means the network can be dealt with more efficiently, therefore reducing support and maintenance costs.
- The PWAN is scalable and flexible to meet the bespoke requirements of each customer. Sites can be added to expand the network as necessary and can also be removed when access is no longer required. Businesses can further utilise the flexibility of the network by enabling remote workers to connect and benefit from the same levels of security and service.

FAST AND EFFICIENT SERVICE

- Data can be exchanged up to 35% faster on a PWAN than via a VPN.
- Multi-site businesses can communicate just as quickly as with a LAN connection.
- Organisations experience a higher quality network than standard broadband users due to the strict security procedures that the firewall introduces.
- Any queries, issues or technical difficulties with the network are dealt with by our in-house engineers.
